

Step3 - screw in the opposite to the pressurized servo-cylinder till the washplate is in neutral position, Lock it - this servocylinder is in the correct position

Step4 - adjust the position of the other servo-cylinder either by performing the previous steps or by screwing it in till it touches the pre-tensioned spring

Step1 - loosen the servo-cylinders

Step2 - create small servo-pressure differential

The washplate is slightly tilted at this point which can be seen by the lines delta P
